Cognitive Domain Overview

Brain Performance Dashboard

Primary visualization — progress bars show each domain score at a glance

Attention & Focus		50 ± 9	Needs Attention
Memory & Recall		62.5 ± 9	Needs Attention
Executive Function		50 ± 9	Needs Attention
Mental Energy		50 ± 9	Needs Attention
Stress & Emotional Load		18.8 ± 9	At Risk
Sleep & Recovery		50 ± 9	Needs Attention
Lifestyle Module		50 ± 9	Needs Attention

■ Sleep

60 / 100

Needs Attention

Sleep quality directly impacts memory consolidation, emotional regulation, and cognitive recovery.

Tip: Aim for 7–9 hours of consistent, quality sleep.

■ Stress

30 / 100

At Risk

Chronic stress elevates cortisol, impairing working memory and executive function over time.

Tip: Daily mindfulness or breathing exercises can reduce stress load.

■ Anxiety

60 / 100

Needs Attention

Anxiety diverts attentional resources and can create cognitive bottlenecks during complex tasks.

Tip: Structured worry time and CBT techniques show strong outcomes.

■ Burnout

30 / 100

At Risk

Burnout depletes mental reserves and reduces motivation, creativity, and sustained performance.

Tip: Recovery blocks and workload distribution are essential.

Primary Contributors to Score

Factors most significantly affecting your cognitive performance

●

40%

Elevated stress load

High cortisol levels are impairing working memory and executive function.

40%

●

28%

Disrupted sleep patterns

Inconsistent sleep is reducing cognitive recovery and mental clarity.

28%

●

18%

Cognitive overload / burnout

Sustained overload is depleting mental reserves and reducing motivation.

18%

●

10%

Moderate anxiety levels

Anxiety is creating intermittent interference during demanding tasks.

AI ANALYSIS

Cognitive Performance Summary

The primary factors affecting cognitive performance appear to be attention regulation, stress load, and recovery quality. Addressing these areas simultaneously may produce measurable improvement.

Behavioral Insights

- Possible stress-related cognitive fatigue
- Possible burnout symptoms
- Possible attention difficulties
- Possible sleep-related memory decline

Potential Causes

- Set a consistent sleep schedule (same time ±30 min on weekends) to stabilise your circadian rhythm before exam
- Try the Pomodoro technique (25 min focused work, 5 min break) during study sessions — structured intervals
- Space your study sessions across multiple days instead of cramming — spaced repetition improves memory
- Limit passive social media scrolling to under 30 minutes daily — heavy use is linked to higher anxiety and lower

Projected Improvement (30 Days)

Future Outlook

Possible stress-related cognitive fatigue

Possible stress-related cognitive fatigue appears to be contributing to reduced cognitive efficiency and wellness patterns.

Wellness Observation

Possible burnout symptoms

Possible burnout symptoms appears to be contributing to reduced cognitive efficiency and wellness patterns.

Wellness Observation

Possible attention difficulties

Possible attention difficulties appears to be contributing to reduced cognitive efficiency and wellness patterns.

Wellness Observation

Possible sleep-related memory decline

Possible sleep-related memory decline appears to be contributing to reduced cognitive efficiency and wellness patterns.

Wellness Observation

Possible mood-related concentration issues

Possible mood-related concentration issues appears to be contributing to reduced cognitive efficiency and wellness patterns.

Wellness Observation

■ IMPORTANT NOTICE

These are wellness observations only and are not clinical diagnoses. Please consult a qualified healthcare professional for medical advice.

Cognitive Strengths

Your standout capabilities and performance advantages

★ Your cognitive profile shows meaningful strengths worth celebrating and building upon. These areas demonstrate resilience and serve as anchors for overall improvement.

Sharp Memory

62.5
/100

1

Memory & Recall

Retention and recall of recently learned information remain reliable.

Needs Attention

Focused Mind

50
/100

2

Attention & Focus

Sustained attention holds up well against distraction during demanding tasks.

Needs Attention

Strategic Thinker

50
/100

3

Executive Function

Planning, decision-making, and cognitive flexibility remain balanced under complexity.

Needs Attention

Strength Distribution — All Scales

1

Week 1 Recovery Optimization

- ☐ Set a consistent sleep schedule
- ☐ Try the Pomodoro technique
- ☐ Space your study sessions

◆ Foundation Building

2

Week 2 Attention Training

- ☐ Try the Pomodoro technique
- ☐ Space your study sessions
- ☐ Limit passive social media

◆ Focus Habits Forming

3

Week 3 Stress Regulation

- ☐ Space your study sessions
- ☐ Limit passive social media
- ☐ Add 20 minutes of moderate exercise

◆ Peak Performance Mode

4

Week 4 Performance Reinforcement

- ☐ Limit passive social media
- ☐ Add 20 minutes of moderate exercise
- ☐ Add 5–10 minutes of box breathing

◆ Optimization & Review

Cognitive Age Tracking Not Yet Active

Additional data points are being collected to establish your cognitive age baseline with high accuracy.

Why Cognitive Age Matters

Cognitive age measures how your mental performance compares to population averages for your chronological age. A cognitive age younger than your actual age indicates strong brain health. Regular assessments allow tracking of improvement over time.

Report Methodology

This report is generated by the Limitless AI cognitive wellness engine using a combination of validated psychometric assessments, self-reported lifestyle data, and proprietary machine learning models trained on large-scale population data.

Medical Disclaimer

This is a wellness screening tool, not a diagnosis. Results should not be used to self-diagnose or treat any medical condition. Always consult a qualified healthcare professional for personalized medical advice.

Data Privacy & Security

Responses not stored unless user explicitly opts in. Data is never sold or shared with third parties without explicit consent. You retain full ownership of your personal wellness data at all times.

HIPAA Readiness

HIPAA safeguards apply when deployed in US healthcare context. Technical and administrative safeguards are in place to protect protected health information (PHI) in alignment with HIPAA guidelines.

Scale Definitions

Attention & Focus (20% weight)

Sustained attention and resistance to distraction during demanding tasks.

Memory & Recall (20% weight)

Short-term retention and recall of recently learned information.

Executive Function (18% weight)

Planning, decision-making, and cognitive flexibility under complexity.

Mental Energy (14% weight)

Subjective mental stamina and resistance to cognitive fatigue.

Stress & Emotional Load (10% weight)

Self-reported stress burden and its perceived impact on daily functioning.

Sleep & Recovery (13% weight)

Sleep quality and its contribution to next-day cognitive recovery.

Lifestyle Module (5% weight)

Broader lifestyle factors (activity, routine, recovery habits) linked to wellness.

Item Bank Version

items_v1.0

Scoring Formula

Overall score is a fixed weighted average of the seven scale scores above. The Cognitive Complaint Index and Modifiable Load Index composites are the unweighted mean of their three constituent scales.

Provisional Values

Standard error, confidence intervals, cognitive age, and percentile all use provisional statistical constants pending empirical calibration against a normed population sample. Treat exact figures as directional, not clinical.

Limitations

This is a self-report wellness screening tool, not a diagnostic instrument. It does not measure brain age, IQ, or clinical cognitive impairment. Consult a licensed clinician for persistent symptoms.
